Toxicity of Chemicals Contained in Everyday Electronic Devices: A European Perspective

Arthur Van Belle

I. Introduction

WHY toxicity in everyday electronics matters ? Most of our electronic devices contains chemicals. Some are inoffensive and other can be harmful. Harmful chemicals are widely used and sometimes for security concern. In Europe, we have a policy to regulate the amount of the toxic known chemicals. Despite this regulation, we are still exposed to these chemicals. This review will focus on the toxicity of chemicals contained in everyday electronic devices from a European perspective. The purpose of this work is to give an overview of the most common toxic chemicals in electronic devices and how they can affect humans.

II. Toxic Substances in Everyday Electronics

Electronic devices can be toxic in multiple ways and we use them everyday. This state of the art report will only treat about the toxicity of the chemicals contained in the devices. It is important to know that not only the electronic components themselves contain toxic compounds but also the metal or plastic casing, the wiring, the solder and other mechanical or electrical items that could be included in most of the electronic devices.

The most common and well-known toixc chemicals are listed in the table 1 in the annexes. Brominated Flame Retardants (BFR) are a big concern since they are used in most of electronic device for safety policies imposed by EU [5]. The BFRs are extremely present in our lives and are able to bioaccumulate. They are dangerous for most of the living beings as they are endocrine disruptors and carcinogenic [2], [3]. They are present in pcb and incorporated in polymers which are used for casing. This means we are almost constantly in contact with BFRs. The two most common BFRs are Polybrominated Biphenyls (PBB) and Polybrominated Diphenyl Ethers (PBDE).

III. Exposure Pathways

The conclusion goes here.

IV. EU Regulatory Framework

The conclusion goes here.

TABLE I
COMMON TOXIC CHEMICALS IN EVERYDAY ELECTRONIC DEVICES — EU LIMITS AND POTENTIAL HAZARDS

Substance	**Max. concentration**	**Common uses**	**Toxicity**
Lead	0.1 %	Solders, cable sheathing, CRT-glass, other components.	
Mercury	0.1 %	Switches, sensors, some lamps or fluorescent elements, older electronic meters/gauges.	
Cadmium	0.01 %	Batteries (e.g. Ni–Cd), electro-plating, coatings, older CRT phosphors, stabilizers in plastics.	
Hexavalent chromium	0.1 %	Corrosion-resistant coatings, metal plating, protective finishes on metal housing or parts.	
PBB	0.1 %	Plastics, housings, insulation, printed circuit boards (PCBs), casings — to reduce flammability.	
PBDE	0.1 %	Plastics, PCBs, cable insulation, housings.	
2-ethylhexyl, DEHP	0.1 %	Plasticizers in cables, insulation, plastic parts, housings.	
BBP, DBP, DIBP	0.1 %	Similar uses: plastic parts, cable insulation, polymer components.
